

Cerebral Palsy Research

- Has your child had Selective Dorsal Rhizotomy (SDR) back surgery for their CP?
- Are they aged 2-18 years?

If YES your participation can help us find out more about the rehabilitation services available for SDR

What's involved?

- This study will not take up any of you or your child's time
- A researcher will review existing information in your child's medical records (with your consent) to collect details about the healthcare services they have had leading up to, and after, their SDR
- The information will help us better understand the children in NZ who have had SDR so that we can work towards improving health service delivery for children with cerebral palsy across New Zealand

If you would like to participate or find out more please contact:
